

ARINARNOA

Variety obtained in 1956 by INRA (France) by crossing Tannat with Cabernet Sauvignon. It has a medium-large cluster, a medium berry with a rounded shape and a herbaceous taste. Vine of average vigour, it has a late bud burst. Well resistant to botrytis, due to medium-sparse cluster and thick pulp, thus adapting to drying. Good and constant yield. Its ripening period is average. It produces wines of great complexity and aromatic persistence, well-structured both in acidity and in alcohol content, with evident tannin content and colouring substances.

Clones in propagation: Arinarnoa (French clone) Inra-Entav 723.
